

## Short Assignment #2

### Where does my water come from?

- 1) Trace your water supply from its source to the tap and from the drain to its disposal. You may contact the local municipal water company, conduct a short windshield survey, or interview relevant community/university members. Draw a map with the various locations identified and the distance between them and your current address. Cite the source(s) you use.
- 2) For ONE day, keep track of all the activities in which you use or consume water. Estimate and list the amount used for each activity and then calculate the total daily usage from your data.
- 3) Try to live on 2 gallons for ONE day (that's the average of a person in Mozambique and Haiti). Fill 2 empty gallon jugs and use the amount wisely for cooking, drinking, bathing, flushing, etc. Describe briefly how this experience compares to #2.

**The assignment is due on Oct 25 at the beginning of class!**
